

The model's 1,942 experiment-unsupported mouse-liver ORF calls are ~92% FALSE POSITIVES, not depth-limited discoveries
and it is not a coverage artifact: 1,061 sit on genes with NO detectable translation in 28 pooled libraries; of the 881 on demonstrably translated genes, only 16.9% are corroborated

A A ~10x shortfall against the control

B Two architectures agreeing is NOT evidence

C The gap holds in EVERY class, including canonical CDS
