

Mouse macrophages, 12 populations: a PREDICTED ORF database vs a REAL Ribo-seq one
On the 11 transfer populations a fixed 506-seq Ribo-seq DB reaches 26 novel peptides vs the model's 24 and is 2.4x denser -- the model's case is NOT needing Ribo-seq, not beating it

A Novel peptides (absolute)

B Cost to the proteome -- all three straddle zero

C Discovery density -- the REAL Ribo-seq DB is denser
