

Wang vs Janich vs model on WANG RNA | theta = 1 (uncalibrated)

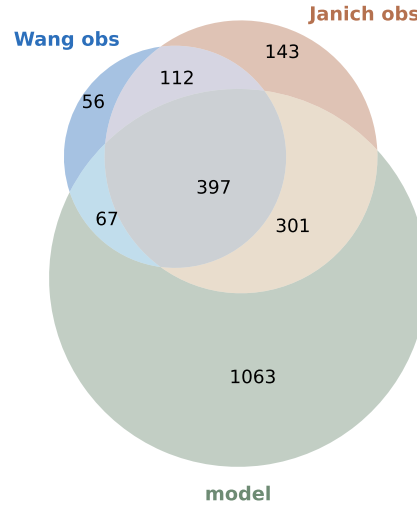

INTERSECTION of TPM ≥ 1
(8,632 tx)

CDS -- INTERSECTION of TPM ≥ 1

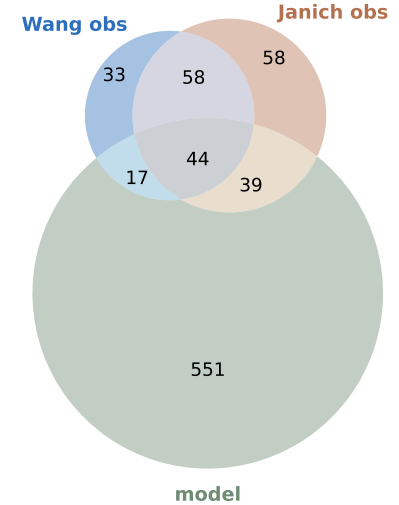

model recovers 553/1,209 (46%) of single-experiment ORFs

uORF -- INTERSECTION of TPM ≥ 1

model recovers 368/567 (65%) of single-experiment ORFs

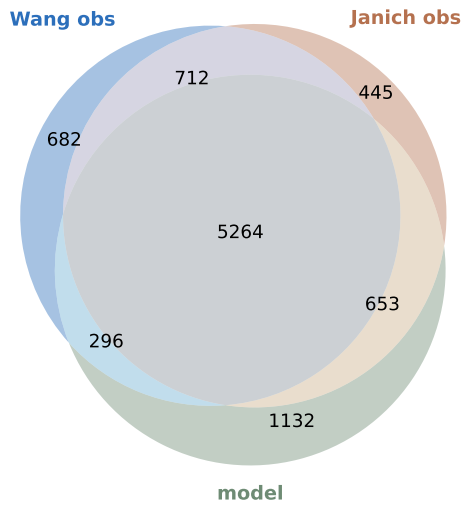

novel -- INTERSECTION of TPM ≥ 1

model recovers 56/147 (38%) of single-experiment ORFs

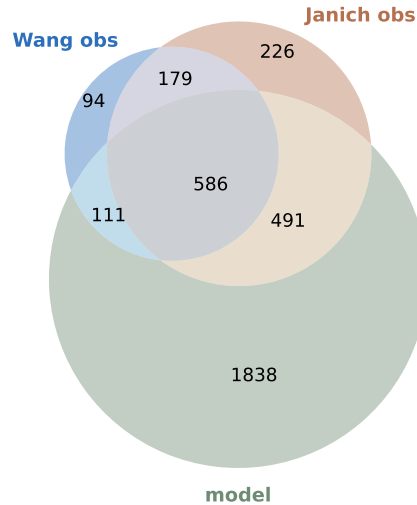

UNION of TPM ≥ 1
(17,209 tx)

CDS -- UNION of TPM ≥ 1

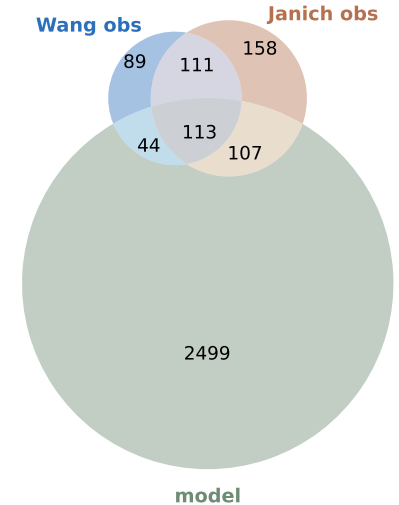

model recovers 949/2,076 (46%) of single-experiment ORFs

uORF -- UNION of TPM ≥ 1

model recovers 602/922 (65%) of single-experiment ORFs

novel -- UNION of TPM ≥ 1

model recovers 151/398 (38%) of single-experiment ORFs

Wang n Janich = the between-experiment reproducibility ceiling. Regions where the model overlaps exactly one experiment are ORFs it recovers that only that experiment detected -- not false positives.
