

Wang vs Janich vs model on JANICH RNA | CDS-anchored Poisson (theta = 0.2)

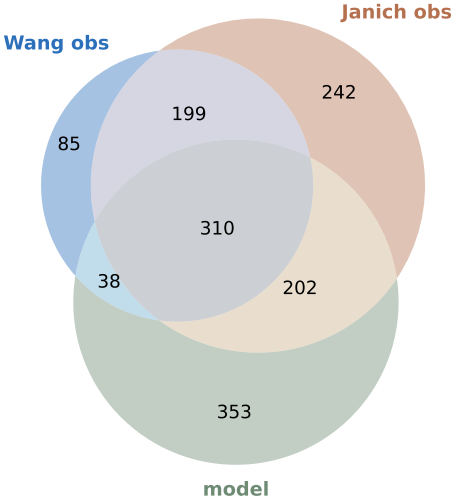

INTERSECTION of TPM>=1
(8,632 tx)

CDS -- INTERSECTION of TPM>=1

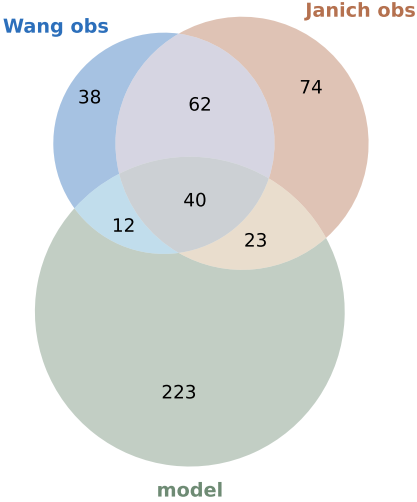

model recovers 533/1,209 (44%) of single-experiment ORFs

uORF -- INTERSECTION of TPM>=1

model recovers 240/567 (42%) of single-experiment ORFs

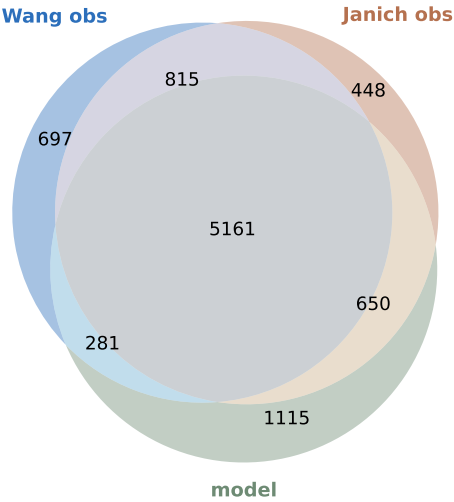

novel -- INTERSECTION of TPM>=1

model recovers 35/147 (24%) of single-experiment ORFs

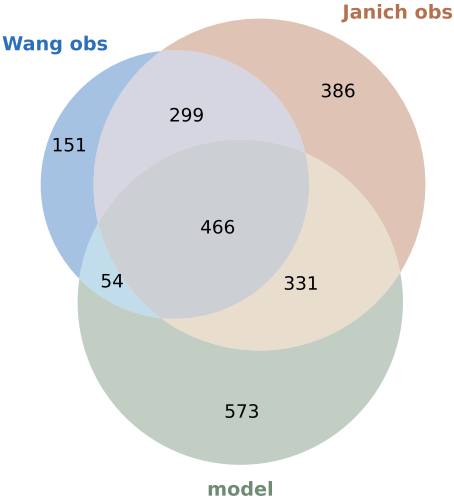

UNION of TPM>=1
(17,209 tx)

CDS -- UNION of TPM>=1

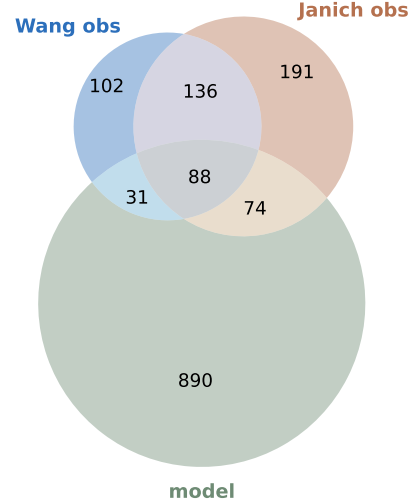

model recovers 931/2,076 (45%) of single-experiment ORFs

uORF -- UNION of TPM>=1

model recovers 385/922 (42%) of single-experiment ORFs

novel -- UNION of TPM>=1

model recovers 105/398 (26%) of single-experiment ORFs

Wang n Janich = the between-experiment reproducibility ceiling. Regions where the model overlaps exactly one experiment are ORFs it recovers that only that experiment detected -- not false positives.
