

Wang vs Janich vs model on JANICH RNA | theta = 1 (uncalibrated)

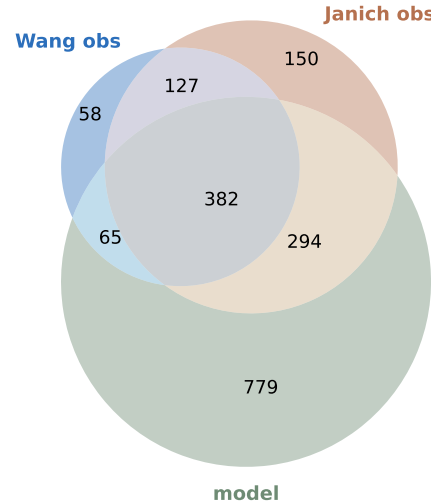

INTERSECTION of TPM ≥ 1
(8,632 tx)

CDS -- INTERSECTION of TPM ≥ 1

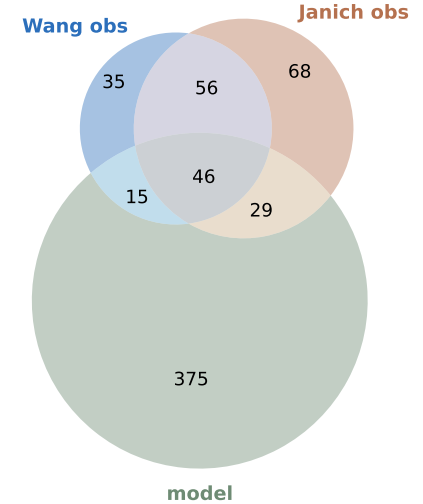

model recovers 530/1,209 (44%) of single-experiment ORFs

uORF -- INTERSECTION of TPM ≥ 1

model recovers 359/567 (63%) of single-experiment ORFs

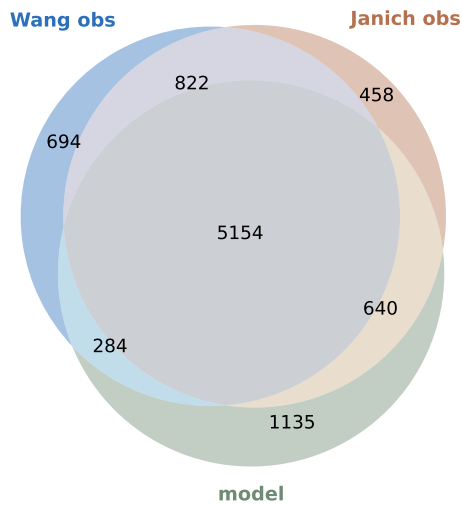

novel -- INTERSECTION of TPM ≥ 1

model recovers 44/147 (30%) of single-experiment ORFs

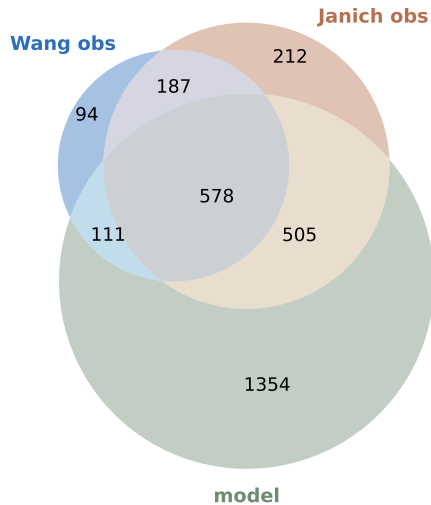

UNION of TPM ≥ 1
(17,209 tx)

CDS -- UNION of TPM ≥ 1

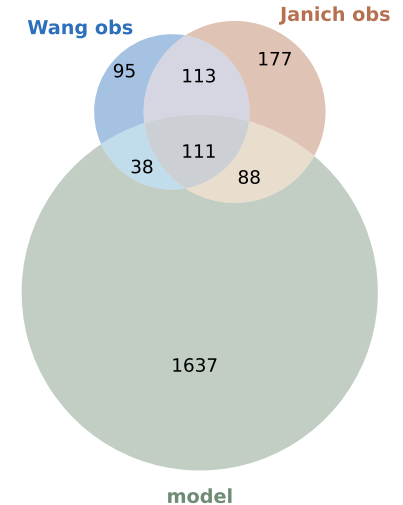

model recovers 924/2,076 (45%) of single-experiment ORFs

uORF -- UNION of TPM ≥ 1

model recovers 616/922 (67%) of single-experiment ORFs

novel -- UNION of TPM ≥ 1

model recovers 126/398 (32%) of single-experiment ORFs

Wang n Janich = the between-experiment reproducibility ceiling. Regions where the model overlaps exactly one experiment are ORFs it recovers that only that experiment detected -- not false positives.
